Small Office/Home Office Complete VoIP PBX Solution

The Snom360 IP phone is a high quality, sophisticated device designed for maximum productivity & efficiency in the office. See [Snom's website](#) for more information. Each Snom360 has two network ports allowing you to connect a PC workstation to the phone. This means you don't have to run two network cables to each desk.

Our Intertex IX66+ firewall/router device comprises of a network router, Sip-aware business class firewall, ADSL modem, Quality-of-Service functionality & PSTN gateway all in one box. This means that not only can you reliably make VoIP calls but you can breakout onto the PSTN line (e.g. for local calls). The Intertex can be setup to automatically route calls to the cheapest line – either PSTN or over the Internet. There is also an optional wireless card available for the IX66+ which means you can setup your own wireless network.

Also available is the IX67 router which has similar capabilities as the IX66+ but with a higher throughput. As a general rule, the IX66+ will support up to 30 users & 10 simultaneous calls where as the IX67 supports up to 50 users & 30 simultaneous calls. So your choice of router depends on the size of your office.

Intertex optional SIP-switch software adds PBX functionality to the Intertex router. Such as the ability to call internally using extension numbers, URLs, or conventional phone numbers. The restriction of incoming callers through features like a blacklist and a white list based on various criteria.

Installation & Support – at Provu we deal with a wide range of customers with a wide range of IT/VoIP skills. We can customise this package to meet your exact needs – the model shown is a typical example. If you wish to set everything up yourself we can merely provide all the hardware necessary or we can install a complete system in your office as long as the underlying CAT5 cabling is in place. In order to help you get the most from this VoIP system we offer as much support as you require.
